Atmel Corporation is in beta with **XSense**, a flexible touch-panel technology that you can roll it up).

Atmel says XSense touch will not only enable a new generation of smartphones and tablets, but also transform the large screen market as well.

Based on a proprietary roll-to-roll metal mesh technology, XSense touch sensors offer such advantages as “flawless” touch performance, enhanced noise immunity, low sheet resistance and low power consumption.

Product designers can turn touch-based concepts into functional designs at lower total system costs compared to current market alternatives.
