

The LG Take on Enterprise

Written by Marco Attard
18. October 2013

As BlackBerry appears to be on the way out LG goes for a slice of the enterprise mobility market with Gate, a technology package combining the company's virtualisation, security and BYOD offerings.

Currently available for the G2 smartphone, Gate provides a "seamless" virtualisation experience by simultaneously running 2 operating systems (one handling personal data, the other business) on the same device.

It also includes data encryption, Microsoft Exchange ActiveSync, VPN and jmobile device management (MDM) capabilities.

“With the increasing popularity of BYOD, employees alike are demanding improved work solutions for mobile,” the company says. “LG GATE satisfies the need for both company security and individual privacy. As a respected mobile communications industry leader, LG will continue to deliver exceptional user experiences to all of its valued customers.”

Gate should be first available in the US from Q2 2013.
