ZBoost's zPocket YX110 signal booster is ideal for travellers-- the unit extends a single mobile's signal in a compact package requiring no installation.

Users place the base unit on a window while the mobile device sits in the pocket antenna. A 20' cable connects the antenna to the base unit.

One can then use the phone through either its speakerphone or any headset.

The booster is currently compatible with mobile devices using 800 and 1900 MHz signals.
