

The Boogie Board Now Saves

Written by Marco Attard

Improv Electronics presents a new version of the Boogie Board eWriter at IFA 2011, adding one previously missing feature-- the Boogie Board Rip, with save capabilities.

If one remembers, the Boogie Board is a bare-bones writing pad with a pressure sensitive reflex LCD for users jot down notes on before erasing everything with a button press (just like chalk boards from pre-electronic days).

The 9.5" Boogie Rip (Rip stands for "Record. Image. Preserve.") has an internal memory, on which it saves doodles and notes in .pdf format, before users export to their PCs via mini-USB port and included software.

It still uses a reflex LCD display-- using power only to erase for erasing, with a battery Improv says lasts over a week per charge.

The Boogie Board Rip should start shipping from November 2011.
