JBL gets into the wireless speaker market as it launches the On Tour iBT speaker and tablet kickstand combination.

It supports both A2DP and AVRCP Bluetooth profiles, and users can also connect devices directly via either stereo mini jack or USB adapter (which also charges devices when speaker is connected to AC power).

Inside are four JBL Odyssey neodymium transducers, with 100Hz-20kHz frequency response, as well as computer-optimised equalisation and optimised compression topology adjusting dynamic range at high volume levels.

A built-in microphone allows for FaceTime video calls (on iPad 2 or iPhone), as well as hands-free calls on any Bluetooth phone.

The package includes an adjustable tablet kick stand, while speaker control comes through metal touch buttons.
