

Turning iDevices into Recorders

Written by Marco Attard
02. December 2011

Customers looking for a dictaphone might find an ideal replacement in the Tascam iM2 Stereo Microphone-- an iPhone accessory turning the mobile device into a stereo recorder.

It carries x2 condenser microphones (the same found in Tascam's DR-series recorders) and plugs into Apple dock connectors. The microphones are adjustable over 180-degrees, with uni-directional elements arranged in an AB pattern for detailed stereo imaging.

A built-in microphone pre-amp allows it to handle up to 125dB sound levels, while a stereo limiter tames sudden loud sounds.

It takes power through the dock connector (meaning it needs no batteries), and works with any recording app, including the built-in video camera and a free companion recording app.
