Archos hopes to make your customers buy a home phone again with the Archos 3S smart home phone, putting smartphone-style features in a more traditional DECT phone.

The device looks like a regular smartphone, complete with a 3.5" touchscreen and a sleek design. Powering it is Android 2.2 (aka Froyo), allowing for a range of additional features-- web and email access, social networking, media playback (photos, music and video) and even games.

In addition it has name and number memory, hands free option, intercom and RCHOScaller ID functionality.

It is compatible with any ADSL box or phone line, using standard DECT protocols.
