

Microsoft Makes Keyboard for Mobile Devices

Microsoft launches the Mobile Keyboard 500-- a full-size Bluetooth keyboard aiming for use with mobile devices, especially tablets.

It has a comfort curve design, encouraging natural posture by placing arms and wrist at a more natural position, and is only 1.6cm thick and 35cm wide (a little wider than the standard notebook). The colour is matte black with a white underside.

It works with any device with Bluetooth connectivity, including most Android tablets and the iPad-- and a driver even provides Apple "Command" button functionality. Power comes through x3 AAA batteries, and a battery status indicator lets users know when power is low.
