LG reveals what it claims is one of the smallest mobile printers around at CES 2014-- the Pocket Photo 2.0 (model PD239), a miniature device able to print 5.1 x 7.6cm photos from iOS and Android devices.

The company says the mini-printer is 4mm thinner than the first Pocket Photo model, and uses ZINK technology to print at 313dpi. It connects to mobile device via NFC or Bluetooth after the installation of a free Pocket Photo app.

Users can also embed QR codes in photos for enhanced sharing.

“Printed photos have a sentimental appeal that digital images are not truly able to replicate,” LG says. “Our newest Pocket Photo embraces the emotional aspect of the printed photo while offering a level of portability and convenience that are missing from today’s digital cameras.”

The Pocket Photo rolls out in European territories from 2014 in pink, white and yellow colour options.
